Workshop in Methods Karl F. Schuessler Institute for Social Research

Your Statistical Toolbelt (in SPSS)

Stephanie Dickinson

Senior Statistical Consultant Department of Epidemiology and Biostatistics, School of Public Health

This introductory workshop will give an overview of how to identify what types of data analysis tools to use for a project, along with basic "DIY" instructions. We will discuss the most common analysis tools for describing your data and performing significance tests (ANOVA, Regression, Correlation, Chi-square, etc), and how they should be selected based on the type of data and the type of research question you have. This is geared towards students or faculty beginning their foray into quantitative analysis of research data, or

those who have been around but would like to step back and get a framework for how to navigate basic statistical methods.

This workshop is part 2 of our SPSS workshop series for Fall 2016. Join us for part 1, "SPSS: The Basics" with IT Training, on Thursday, October 27, 2016, 5:30-8:30pm. Reserve your spot for Part 1 by registering at http://go.iu.edu/1jxM.

Friday, October 28, 2016, 2-4pm
